CANDLE FIXES

For every candle question, there's a CandleOra solution — your trusted guide to keep the glow alive.

Candle Stops Burning in the Middle

Cause: Wick might be buried in wax or too short.

Fix:

- Extinguish the candle and let it cool completely.
- Use a spoon or wick tool to gently remove a small amount of wax around the wick.
- Trim the wick to about ¼ inch and relight.

Uneven Burning or Tunneling

Cause: Wick not centered or not burning long enough on the first use.

Fix:

- On the next burn, allow the wax to melt all the way to the edges.
- If tunneling is already there, use a foil wrap around the candle's rim to help even it out.

Low Flame or Weak Scent Throw

Cause: Wick trimmed too short or fragrance not dispersing.

Fix:

- Gently pour out a little melted wax or scoop it with a spoon.
- Relight to let the wick breathe and flame grow.

Mushrooming Wick

Cause: Wick is too long or has carbon build-up.

Fix:

- Extinguish the candle.
- Trim the mushroomed tip before relighting.
